(54) SEPARATOR FOR SECONDARY BATTERY

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a separator for a secondary battery which can be manufactured in such a manner that hydrophilicity can be added in a state of fiber before an end product, an arbitrary control for enlarging or reducing a specific surface area of fiber can be performed, and a process of adding hydrophilicity, for example, an economical noncontact sulfonation process can be performed without a strong oxidizing power.

SOLUTION: The separator for secondary battery includes a polyolefine fiber to which hydrophilicity has been added and fiber for contact and is manufactured in a wet multi-layer. The polyolefine fiber to which hydrophilicity has been added is made of a plurality of kinds of polypropylene fiber each of which has a different thickness. A specific surface area of at least one kind polypropylene fiber among a plurality of kinds of polypropylene fiber each of which has a different thickness has a value which is equal to or larger than 1.5 m²/g. A process for adding hydrophilicity is based on system of a non-contact sulfonation process. The noncontact sulfonation process is subjected to a surface of the polyolefine fibril and a surface of the fiber for contact, and to thereby enable a process of gradually adding hydrophilicity under control. The noncontact sulfonation process consumes small energy to facilitate a later process.
